## DETAILED ACTION

### *Double Patenting*

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-32 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-37 of U.S. Patent No. 7,270,738.

Although the conflicting claims are not identical, they are not patentably distinct from each other because the present claims and the claims of Patent ‘738 are both drawn to a catalyst, a substrate and a silica-alumina matrix used for a hydrocracking/hydroconversion process under similar operating conditions. The only difference is that the Patent ‘738 claims SiO<sub>2</sub> content in the silica-alumina matrix in a

range of 10-80%, total pore volume in a range of 0.1 to 0.6 ml/g and BET surface area of the catalyst in a range of 150 to 500 m<sup>2</sup>/g. The present invention claims SiO<sub>2</sub> content in the silica-alumina matrix in a range of 5 to 95%, total pore volume in a range of 0.2 to 0.5 ml/g and BET surface area in a range of 100-600 m<sup>2</sup>/g. It would have been obvious to one skilled in the art at the time of invention to modify the claims of Patent '738 because the ranges of SiO<sub>2</sub> content, total pore volume, and BET surface area in Patent '738 are overlapping the claimed ranges.
